research interests

With the recent success of the *Kepler* and K2 missions, and the ongoing release of data from *Gaia* and TESS, we are in possession of a vast amount of astronomical data. I am interested in leveraging these large data sets to make inferences of stellar physics, & analysis systematics. I do this through a Bayesian use of populations of asteroseismic data, in combination with other sources. I have used hierarchical models to study systematics and constrain the Red Clump standard candle to unprecedented precision. My current work focuses on studying the relation between mass, rotation and age of solar-like stars in *Kepler* and K2 fields.
