research interests

With the recent successes the *Kepler*, K2, *Gaia* and TESS missions, we have access to a vast amount of astronomical data. I am interested in leveraging these data to draw new inferences of stellar physics through Bayesian population studies of asteroseismic data. I previously used hierarchical latent variable models to constrain the red clump distance ladder to an unprecedented precision. I am currently studying the relation between mass, age and rotation of solar-like stars in the *Kepler* field, and the correlation between properties of red clump giant populations.
